

# Hotel Reservation System and Inventory System

IGP PATVEP Hostel and University Canteen

Bataan Peninsula State University, Main Campus

## UI WIREFRAME DOCUMENT

Layout studies for the seven screens of the system. Low fidelity on purpose: grey blocks, labels and annotations. A wireframe settles layout, hierarchy and flow. Colour, type and spacing are settled separately in the build.

PREPARED BY

**Angelo Andrei P. Sierra**

Frontend and UI/UX Developer, BSIT-NW3A

### CONTENTS

|    |                       |         |           |
|----|-----------------------|---------|-----------|
| 1. | Dashboard             | WBS 8.1 | A. Sierra |
| 2. | Scheduling & Calendar | WBS 6.1 | A. Sierra |
| 3. | Audit Trail           | WBS 7.1 | A. Sierra |
| 4. | Reports               | WBS 9.1 | A. Sierra |
| 5. | User Management       | WBS 3.1 | A. Santos |
| 6. | Canteen Inventory     | WBS 4.1 | A. Santos |
| 7. | Hotel Reservation     | WBS 5.1 | A. Santos |

NOTES

- 1 Four figures, never more.**  
Occupancy, rooms free, arrivals and low stock are what staff act on when they sit down. A fifth tile wraps the row and weakens the hierarchy.
- 3 Hostel and canteen share one screen.**  
The charter asks for a single platform, so the two sides of the operation are deliberately not split across separate dashboards.
- 5 Alerts are a list, not a chart.**  
A low stock warning has to name the item. A chart would hide exactly the detail that makes the alert worth showing.

- 2 Occupancy gets the largest block.**  
A week of bars answers "are we filling up" faster than a table, and today is marked so the reader has an anchor.
- 4 Quick actions sit top right.**  
Shortcuts to the task a user arrived wanting to do. The eye finishes a left to right scan here, so it is where an action belongs.

3SELECTED DAY

4CONFLICT DETECTION

UI shell | sample data

NOTES

- 1

Two views, one switch.

A month grid answers "what happens on the 14th". A room timeline answers "which rooms are free next week". Front desk staff need both, so the switch sits in the toolbar rather than on a separate page.
- 2

Every day cell carries a load figure.

A small count in the corner lets a staff member judge availability without opening the day.
- 3

The detail panel never covers the calendar.

Clicking a day fills the right column instead of opening a dialog, so the reader keeps their place in the month.
- 4

Conflicts are listed, not just blocked.

A refusal has to say what it clashed with. Each finding names the booking or room block it hit so the user can act on it.

UI shell | sample data

NOTES

- 1

**Time reads first, left to right.**

An audit trail is read chronologically. The timestamp takes the first column so a reader can scan down it without crossing the row.
- 2

**One row is one event.**

Who, what, which record, and what happened. Nothing is grouped or summarised, because an audit trail that hides rows is not an audit trail.
- 3

**Result is a marker, not a sentence.**

Success and failure need to be separable at a glance while scanning hundreds of rows, and must not rely on colour alone.
- 4

**Filtering is the whole feature.**

A log is only useful if you can narrow it. Date range, user and action type sit above the table, always visible, never behind a menu.

4Generate report

UI shell | sample data

NOTES

- 1

The summary is the page, the controls are the sidebar.

People open reports to read a figure, not to configure one. The result takes the dominant column and the settings sit beside it.
- 3

Controls stay visible while reading.

Adjusting a date range and seeing the summary change is the main loop of this screen, so the panel never collapses or moves behind a dialog.

- 2

Figures right aligned in a fixed column.

Numbers are compared down the page, not across, so they line up on a single edge in tabular figures.
- 4

One primary action.

Generate is the only filled control on the screen. Everything else is a field or a plain button, so there is no doubt what to press.
